DETAILED ACTION

Allowable Subject Matter

1. Claims 1, 2, 4-8 and 10-43 are allowed.

As to claims 1, 24 and 39-43 the prior art made of record failed to teach a method for transferring data (receiving) in a wireless communication system comprising transferring the second data stream from the second component through the first component which combines the first data stream and the second data stream to form a third data stream running at a third frequency which is the sum of the first frequency and the second frequency and sending the third data stream to a third component wherein each of the first component and the second component is a radio frequency sub unit that are for use in an access point of the wireless communication system.

As to claims 13, 29 and 36, the prior art made of record failed to teach a method for transferring (transmitting) data where a third component combining the first data stream and the second data stream to form a third data stream running at a third frequency being the sum of the first frequency and the second frequency and transferring the third data stream from the third component through the first component which separates the third data stream to the first data stream and the second data stream, then sends the second data stream to the second component.

Conclusion

2. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure. Eng et al. (U.S. Patent 6,771,933) discloses WLAN access points using distribute antenna architecture. Slabainski (U.S. Patent 6,374,124) discloses a broadband distribution network to connect a plurality of remote wireless transceivers with multiple antenna to a base station to handle telephone traffic in alternate areas. Stratford et al. (U.S. Patent 6,785,558), though pre-dated by the applicant's invention, teaches a method for distributing remote site access nodes with multiple diversity antenna units.
